What You'll Learn

By the end of this tutorial, you will be able to:

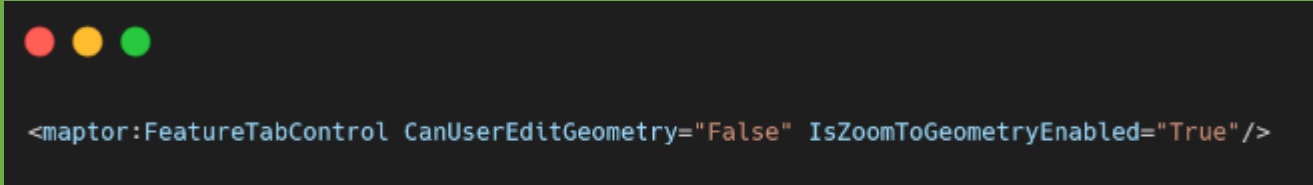

- Add an **attribute table control** to your app so that you can:
 - Display attributes for different layers on **separate tabs**.
 - Automatically highlight a feature on the map by selecting its row in the table.
 - **Zoom** to a selected feature directly from the table.
 - **Export attribute data** to Excel.
 - **Create a new drawing item** from the selected row's geometry.

Note: *You can also create custom commands for the attribute table. However, that goes beyond the scope of this tutorial and will be covered in a future lesson.*

Add the Feature Table Control in XAML

Use *FeatureTabControl* in your layout.

It will automatically use the current *DataContext* and bind tabs and tables to your layers and their features.

```
<maptor:FeatureTabControl CanUserEditGeometry="False" IsZoomToGeometryEnabled="True"/>
```

This simple step enables the feature table functionality for all layers in your map.

Full Sample Code

A complete working example is available on [GitHub](#)¹.

After cloning the project, update your *App.xaml* to set *AttributeTableWindow.xaml* Window as the *StartupUri*.
